Jaiye Adeboye

Backend Engineer, Node.js and TypeScript. Real-time, Web3 and fintech systems.

Lagos, Nigeria (open to remote) | +234 705 691 5165 | monjaiye@gmail.com | github.com/jaiy3 | jaiyeadeboye-portfolio.vercel.app

SUMMARY

Backend engineer with 3+ years building APIs and services for Web3 and fintech products, including two years working remotely for a US decentralised-storage company and shipping on Zap Africa, a Nigerian crypto exchange. I design REST and real-time services in Node.js and TypeScript, backed by PostgreSQL and Redis, with a focus on security, reliability and tested code. First Class Computer Science graduate (4.62/5.00).

EXPERIENCE

Backend Engineer Sia Tech (US, decentralised storage), remote — 2024 – 2026

- Built and maintained REST API endpoints in Node.js and TypeScript serving the platform's web clients, from request validation through business logic to database access.
- Implemented authentication and role-based authorisation, and hardened endpoints against common security risks.
- Integrated third-party services into backend workflows, with error handling and retries so external failures did not break user requests.
- Investigated and fixed production issues by tracing them through logs and data, improving the stability of live services.
- Wrote tests, reviewed code and shipped features end to end in a distributed team working across US and Nigerian time zones.

Software Engineer Parallag Technologies, Lagos — 2023 – 2024

- Built backend features for Zap Africa, a Nigerian crypto exchange, working across services in C#, JavaScript and Python.
- Developed APIs and PostgreSQL data logic behind user-facing exchange features.
- Tested and debugged releases through fast iteration cycles alongside product and frontend engineers; delivered backend work on enterprise client applications.

Software Engineering Intern Bluechip Technologies, Lagos — 2022

- Worked in the engineering team behind a bank-grade cash management platform used by Nigerian financial institutions.
- Supported feature delivery, integration testing and database validation under banking reliability and audit standards.

PROJECTS

MarketPulse real-time market data API with a live dashboard — live · code

- Ingests a live Binance trade stream, validates every event with Zod, and fans prices out to subscribed WebSocket clients through Redis pub/sub.
- Moved database writes off the hot path into a BullMQ queue with idempotent job IDs, so bursts and retries never create duplicate price records.
- Serves cached latest prices and paginated, indexed history over a documented REST API (OpenAPI), with JWT auth, rate limiting and Helmet.
- Queue writes retry with exponential backoff and migrations apply automatically on deploy; Pino logs, Prometheus metrics, health checks and CI.

AtlasAI Web3 portfolio analytics with an AI assistant — demo · code

- Aggregates Ethereum balances, ERC-20 tokens, NFTs and transaction history from Alchemy, plus live market prices, into one portfolio API.
- Built an AI assistant that answers questions grounded in the user's actual portfolio and market data rather than generic model knowledge.
- Wallet connection via WalletConnect, Wagmi and Viem, alongside JWT auth with bcrypt and Zod-validated endpoints.

SKILLS

Languages	TypeScript, JavaScript, SQL, Python, C#; React, Tailwind CSS and Vite on the frontend
Backend	Node.js, Express, REST API design, WebSockets, JWT auth, Zod, BullMQ, rate limiting
Data	PostgreSQL, Prisma, Redis (caching, pub/sub), indexing and pagination
Infrastructure	Docker, Docker Compose, GitHub Actions CI, Render, Railway, Vercel
Quality and ops	Vitest, Supertest, OpenAPI/Swagger, Pino logging, Prometheus metrics
Web3 and AI	Ethereum, Alchemy, Wagmi, Viem, WalletConnect, OpenAI and OpenRouter APIs

EDUCATION AND LEADERSHIP

B.Sc. Computer Science, First Class (CGPA 4.62/5.00) Babcock University

- Elected Executive President of the Babcock University Graduating Class (BUGC). Member, Google Developer Student Club (GDSC).
