SUMMARY

Full-stack engineer with 3+ years building web products for Web3 and fintech, including two years working remotely for a US decentralised-storage company and shipping on Zap Africa, a Nigerian crypto exchange. I build end to end, from React and TypeScript interfaces to Node.js APIs on PostgreSQL and Redis, with my deepest experience on the backend. First Class Computer Science graduate (4.62/5.00).

EXPERIENCE

Backend Engineer Sia Tech (US, decentralised storage), remote 2024 – 2026

- Built and maintained REST APIs in Node.js and TypeScript serving the platform's web clients, from validation through business logic to data access.
- Implemented authentication and role-based authorisation, and hardened endpoints against common security risks.
- Integrated third-party services with error handling and retries, so external failures didn't break user requests.
- Investigated and fixed production issues by tracing them through logs and data, improving the stability of live services.
- Wrote tests, reviewed code and shipped features end to end in a distributed team working across US and Nigerian time zones.

Software Engineer Parallag Technologies, Lagos 2023 – 2024

- Built backend features for Zap Africa, a Nigerian crypto exchange, working across services in C#, JavaScript and Python.
- Developed APIs and PostgreSQL data logic behind user-facing exchange features.
- Tested and debugged releases with product and frontend engineers; delivered backend work for enterprise clients.

Software Engineering Intern Bluechip Technologies, Lagos 2022

- Worked in the engineering team behind a bank-grade cash management platform used by Nigerian financial institutions.
- Supported feature design, integration testing and database work in C# and SQL under banking reliability and audit standards.

PROJECTS

PayLedger full-stack payments ledger with a sandbox dashboard live · code

- Built end to end: a React and TypeScript dashboard on an Express and PostgreSQL API, where each visitor gets a private sandbox to move money, retry requests and fire 20 transfers at once, with results drawn live.
- Each transfer runs as one transaction with ordered row locks and idempotency keys, so concurrent or retried requests never overdraw or double-charge; ledger rules are enforced in PostgreSQL and webhooks use a signed transactional outbox. 35 tests in CI.

AtlasAI Web3 portfolio analytics with an AI assistant demo · code

- Built the React and TypeScript dashboard (balances, tokens, NFTs, activity chart, live watchlist, AI chat) with loading, empty and error states, and wallet connection via WalletConnect, RainbowKit, Wagmi and Viem.
- Express API fans out to Alchemy in parallel; the AI assistant answers from the real portfolio and live prices.

MarketPulse real-time market data API with a live dashboard live · code

- Live browser dashboard on the API's own WebSocket and REST endpoints; Binance trades flow through Redis pub/sub to clients and a BullMQ queue to PostgreSQL, with idempotent job IDs.

SKILLS

Frontend	React, TypeScript, Vite, React Router, Tailwind CSS, responsive UI, Axios
Backend	Node.js, Express, REST API design, WebSockets, JWT auth, Zod, BullMQ, rate limiting
Data	PostgreSQL, Prisma, Redis (caching, pub/sub), indexing and pagination
Web3 and AI	Ethereum, Wagmi, Viem, RainbowKit, WalletConnect, Alchemy, OpenAI and OpenRouter APIs
Infrastructure	Docker, GitHub Actions CI, Vercel, Render; Vitest, Supertest, OpenAPI
Languages	TypeScript, JavaScript, SQL, Python, C#

EDUCATION AND LEADERSHIP

B.Sc. Computer Science, First Class (CGPA 4.62/5.00) Babcock University

- Research prototype: blockchain e-voting system for Nigerian elections (Python, Flask) with proof-of-work mining and peer consensus over REST; documented its security and scalability limits.
- Elected Executive President of the graduating class (BUGC). Member, Google Developer Student Club.
