SUMMARY

Backend engineer with 3+ years building APIs and services for Web3 and fintech products, including two years working remotely for a US decentralised-storage company and shipping on Zap Africa, a Nigerian crypto exchange. I design REST and real-time services in Node.js and TypeScript, backed by PostgreSQL and Redis, with a focus on security, reliability and tested code. First Class Computer Science graduate (4.62/5.00).

EXPERIENCE

Backend Engineer Sia Tech (US, decentralised storage), remote 2024 – 2026

- Built and maintained REST APIs in Node.js and TypeScript serving the platform's web clients, from validation through business logic to data access.
- Implemented authentication and role-based authorisation, and hardened endpoints against common security risks.
- Integrated third-party services with error handling and retries, so external failures didn't break user requests.
- Investigated and fixed production issues by tracing them through logs and data, improving the stability of live services.
- Wrote tests, reviewed code and shipped features end to end in a distributed team working across US and Nigerian time zones.

Software Engineer Parallag Technologies, Lagos 2023 – 2024

- Built backend features for Zap Africa, a Nigerian crypto exchange, working across services in C#, JavaScript and Python.
- Developed APIs and PostgreSQL data logic behind user-facing exchange features.
- Tested and debugged releases with product and frontend engineers; delivered backend work for enterprise clients.

Software Engineering Intern Bluechip Technologies, Lagos 2022

- Worked in the engineering team behind a bank-grade cash management platform used by Nigerian financial institutions.
- Supported feature design, integration testing and database work in C# and SQL under banking reliability and audit standards.

PROJECTS

PayLedger double-entry payments ledger API live · code

- Built a ledger API where each transfer runs as one PostgreSQL transaction with accounts locked in a fixed order; tested against 30 simultaneous transfers (no overdrafts) and opposite-direction transfers (no deadlocks).
- Made retries safe with idempotency keys stored atomically with the ledger writes, and enforced the rules in the database itself: deferred triggers for balanced entries, CHECK constraints, append-only postings.
- Signed webhooks via a transactional outbox with SKIP LOCKED dispatch and exponential backoff; reconciliation recomputes every balance from raw postings. 35 tests run in CI.

MarketPulse real-time market data API with a live dashboard live · code

- Ingests a live Binance trade stream, validates every event with Zod, and fans prices out to WebSocket clients through Redis pub/sub.
- Moved database writes off the hot path into a BullMQ queue with idempotent job IDs and retries; documented REST API (OpenAPI) with JWT auth, rate limiting, Prometheus metrics and CI.

AtlasAI Web3 portfolio analytics with an AI assistant demo · code

- Aggregates Ethereum balances, tokens, NFTs and transactions from four Alchemy sources in parallel into one priced portfolio API, with an AI assistant grounded in that data. React frontend with WalletConnect, Wagmi and Viem.

SKILLS

Languages	TypeScript, JavaScript, SQL, Python, C#; React, Tailwind CSS and Vite on the frontend
Backend	Node.js, Express, REST API design, WebSockets, JWT auth, Zod, BullMQ, rate limiting
Data	PostgreSQL, Prisma, Redis (caching, pub/sub), indexing and pagination
Infrastructure	Docker, GitHub Actions CI, Render, Vercel; Vitest, Supertest, OpenAPI, Pino, Prometheus
Web3 and AI	Ethereum, Alchemy, Wagmi, Viem, WalletConnect, OpenAI and OpenRouter APIs

EDUCATION AND LEADERSHIP

B.Sc. Computer Science, First Class (CGPA 4.62/5.00) Babcock University

- Research prototype: blockchain e-voting system for Nigerian elections (Python, Flask) with proof-of-work mining and peer consensus over REST; documented its security and scalability limits.
- Elected Executive President of the graduating class (BUGC). Member, Google Developer Student Club.
